

THE STORY OF POLINCOGNITO

This is the story of a `being` which lives secretly in a very ancient region, which may be located anywhere on the earth (where doesn't matter).

- It has to exist!

That is what everyone who investigated its existence said, as the evidences were many, such as: trails, footprints, food leftovers... Even though his main characteristic was been an invisible creature.

Polincognito followed its schedule normally everywhere without ever been seen by anyone. This fact bothered the authorities back then, as they didn't have any control over it, and they didn't really know what he represented, or what he could influence... That was not good.

As nobody could see him, there was already a large group of men stating that Polincognito was not real, and that everything was no more than imagination.

One day, two very intelligent and respected investigators from a city called Gocachi had an idea; they came up with a plan and decided to use it to prove the existence of Polincognito, as the society of that time was restless with all that mystery.

So, the investigators set up a very thin net assembled on a path where the mysterious been usually passed through and they said:

- If Polincognito really exists, when he passes through the net, it will shake and therefore, everything will be clarified!

They waited... and waited... and waited a long time! And nothing!?! They changed the position of the net many times horizontally and even then, nothing was observed, found or registered.

Some observers who were following that important investigation have proposed another explanation:

- There is the possibility that it bite be so `delicate` and subtle, that it might pass through the net unnoticed by us...

But the majority of people, including both investigators, started believing that Polincognito did not exist in fact... Ignoring all evidence.

A few days later, there came an unknown man by the name of Trebla, saying that he had the solution for the case, and he also said to the investigators:

- In fact Polincognito does not exist nor does it have to in order to produce the evidence, because in truth, or really exists is Huncognito, and to prove his existence all have to do is place and net spread out on the floor (not standing like

before), as, according to my own predictions, he will pass through this region in two weeks ended everyone will be able to see the net bending down.

To everyone's surprise, at the appointed time, everyone was able to see the net 'bending' as had been foreseen by Trebla, who became very famous and respected.

Huncognito Was then held responsible for many strange occurrences within the region, even though he could never be seen. And Polincognito was forgotten by the majority of the society.

Conclusion:

The story of Polincognito is very similar to the story of Michelson and Morley (M&M). Polincognito was Ether, to Huncognito curved space and Trebla Albert Einstein.

This story demonstrates, among other things, how the viewpoint (the position of the observer) might totally affect the comprehension of a natural phenomenon.

The main objective of the M&M experiment was to prove the existence of Ether, which should interfere in the propagation of the light beam at a distance of only 2 meters... Einstein on the other hand, proposed an experiment which would perfectly show an interference and the propagation of a light beam which had traveled thousands of light years coming from a star which faced the earth and which suffered a detour in the proximity of the sun to an observer here on earth...

So, if Space can be curved, it is because it does exist, it has mass, it moves through solar radiation... And to prove that Ether does not exist, or that it doesn't interfere in light?

- How so?

Therefore, everything depends on the observer's viewpoint!

Einstein's best contribution was the following:

Everything is relative!

Who noticed what the difference between Polincognito and Huncognito is?
